

FIGURE 7.1 A Common Way to Visualize an Array

LISTING 7.1 An Array of Temperatures (part 1 of 2)

```
/**
 * Reads 7 temperatures from the user and shows which are above
 * and which are below the average of the 7 temperatures.
 */
import java.util.Scanner;

public class ArrayOfTemperatures
{
    public static void main(String[] args)
    {
        double[] temperature = new double[7];
        // Read temperatures and compute their average:
        Scanner keyboard = new Scanner(System.in);
        System.out.println("Enter 7 temperatures:");
        double sum = 0;
        for (int index = 0; index < 7; index++)
```

```

    {
        temperature[index] = keyboard.nextDouble();
        sum = sum + temperature[index];
    }
    double average = sum / 7;
    System.out.println("The average temperature is " +
        average);

    // Display each temperature and its relation to the average:
    System.out.println("The temperatures are");
    for (int index = 0; index < 7; index++)
    {
        if (temperature[index] < average)
            System.out.println(temperature[index] +
                " below average");
        else if (temperature[index] > average)
            System.out.println(temperature[index] +
                " above average");
        else //temperature[index] == average
            System.out.println(temperature[index] +
                " the average");
    }
    System.out.println("Have a nice week.");
}
}

```

Sample Screen Output

```
Enter 7 temperatures:  
32  
30  
25.7  
26  
34  
31.5  
29  
The average temperature is 29.7428  
The temperatures are  
32.0 above average  
30.0 above average  
25.7 below average  
26.0 below average  
34.0 above average  
31.5 above average  
29.0 below average  
Have a nice week.
```

FIGURE 7.2 Array Terminology

LISTING 7.2 An Array of Temperatures—Revised (part 1 of 2)

```
/**
Reads temperatures from the user and shows which are above
and which are below the average of all the temperatures.
*/
import java.util.Scanner;

public class ArrayOfTemperatures2
{
    public static void main(String[] args)
    {
        Scanner keyboard = new Scanner(System.in);
        System.out.println("How many temperatures do you have?");
        int size = keyboard.nextInt( );
        double[] temperature = new double[size];

        // Read temperatures and compute their average:
        System.out.println("Enter " + temperature.length +
            " temperatures:");

        double sum = 0;
        for (int index = 0; index < temperature.length; index++)
        {
            temperature[index] = keyboard.nextDouble();
            sum = sum + temperature[index];
        }
        double average = sum / temperature.length;
        System.out.println("The average temperature is " +
            average);
    }
}
```

```

// Display each temperature and its relation to the
// average:
System.out.println("The temperatures are");
for (int index = 0; index < temperature.length; index++)
{
    if (temperature[index] < average)
        System.out.println(temperature[index] +
            " below average");
    else if (temperature[index] > average)
        System.out.println(temperature[index] +
            " above average");
    else //temperature[index] == average
        System.out.println(temperature[index] +
            " the average");
}
System.out.println("Have a nice week.");
}
}

```

Sample Screen Output

How many temperatures do you have?

3

Enter 3 temperatures:

32

26.5

27

The average temperature is 28.5

The temperatures are

32.0 above average

26.5 below average

27.0 below average

Have a nice week.

LISTING 7.3 Sales Associate Class

```
import java.util.Scanner;
/**
 * Class for sales associate records.
 */
public class SalesAssociate
{
    private String name;
    private double sales;
    public SalesAssociate()
    {
        name = "No record";
        sales = 0;
    }
    public SalesAssociate(String initialName, double initialSales)
    {
        set(initialName, initialSales);
    }
    public void set(String newName, double newSales)
    {
        name = newName;
        sales = newSales;
    }
}
```

```
public void readInput()
{
    System.out.print("Enter name of sales associate: ");
    Scanner keyboard = new Scanner(System.in);
    name = keyboard.nextLine();

    System.out.print("Enter associate's sales: $");
    sales = keyboard.nextDouble();
}

public void writeOutput()
{
    System.out.println("Name: " + name);
    System.out.println("Sales: $" + sales);
}

public String getName()
{
    return name;
}

public double getSales()
{
    return sales;
}
}
```

FIGURE 7.3 Class Diagram for the Class Sales Reporter

LISTING 7.4 A Sales Report Program (part 1 of 3)

```
import java.util.Scanner;
/**
 * Program to generate sales report.
 */
public class SalesReporter
{
    private double highestSales;
    private double averageSales;
    private SalesAssociate[] team; //The array object is
                                   //created in getData.
    private int numberOfAssociates; //Same as team.length
    /**
     * Reads the number of sales associates and data for each one.
     */
    public void getData()
    {
        Scanner keyboard = new Scanner(System.in);
        System.out.println("Enter number of sales associates:");
        numberOfAssociates = keyboard.nextInt();
        team = new SalesAssociate[numberOfAssociates + 1];
        for (int i = 1; i <= numberOfAssociates; i++)
        {
            team[i] = new SalesAssociate();
            System.out.println("Enter data for associate " + i);
            team[i].readInput();
            System.out.println();
        }
    }
}
```

The main method is at the end of the class.

Array object created here.

SalesAssociate objects created here.

```

/**
 * Computes the average and highest sales figures.
 * Precondition: There is at least one salesAssociate.
 */
public void computeStats()
{
    double nextSales = team[1].getSales();
    highestSales = nextSales;
    double sum = nextSales;
    for (int i = 2; i <= numberOfAssociates; i++)
    {
        nextSales = team[i].getSales();
        sum = sum + nextSales;
        if (nextSales > highestSales)
            highestSales = nextSales; //highest sales so far.
    }
    averageSales = sum / numberOfAssociates;
}

```

← Already processed team[1], so the loop starts with team[2].

```

/**
 Displays sales report on the screen.
 */
public void displayResults()
{
    System.out.println("Average sales per associate is $" +
                       averageSales);
    System.out.println("The highest sales figure is $" +
                       highestSales);
    System.out.println();
    System.out.println("The following had the highest sales:");
    for (int i = 1; i <= numberOfAssociates; i++)
    {
        double nextSales = team[i].getSales();
        if (nextSales == highestSales)
        {
            team[i].writeOutput();
            System.out.println("$" + (nextSales - averageSales)
                               + " above the average.");
            System.out.println();
        }
    }
}

```

```

System.out.println("The rest performed as follows:");
for (int i = 1; i <= numberOfAssociates; i++)
{
    double nextSales = team[i].getSales();
    if (team[i].getSales() != highestSales)
    {
        team[i].writeOutput();
        if (nextSales >= averageSales)
            System.out.println("$" + (nextSales -
                averageSales) + " above the average.");
        else
            System.out.println("$" + (averageSales -
                nextSales) + " below the average.");
        System.out.println();
    }
}
}
public static void main(String[] args)
{
    SalesReporter clerk = new SalesReporter();
    clerk.getData();
    clerk.computeStats();
    clerk.displayResults();
}
}

```

Sample Screen Output

```
Enter number of sales associates:
3
Enter data for associate number 1
Enter name of sales associate: Dusty Rhodes
Enter associate's sales: $36000
Enter data for associate number 2
Enter name of sales associate: Natalie Dressed
Enter associate's sales: $50000
Enter data for associate number 3
Enter name of sales associate: Sandy Hair
Enter associate's sales: $10000
Average sales per associate is $32000.0
The highest sales figure is $50000.0
The following had the highest sales:
Name: Natalie Dressed
Sales: $50000.0
$18000.0 above the average.
The rest performed as follows:
Name: Dusty Rhodes
Sales: $36000.0
$4000.0 above the average.
Name: Sandy Hair
Sales: $10000.0
$22000.0 below the average.
```

LISTING 7.5 Indexed Variables as Arguments

```
import java.util.Scanner;

/**
 * A demonstration of using indexed variables as arguments.
 */
public class ArgumentDemo
{
    public static void main(String[] args)
    {
        Scanner keyboard = new Scanner(System.in);
        System.out.println("Enter your score on exam 1:");

        int[] nextScore = new int[3];

        for (int i = 0; i < nextScore.length; i++)
            nextScore[i] = firstScore + 5 * i;

        for (int i = 0; i < nextScore.length; i++)
        {
            double possibleAverage =
                getAverage(firstScore, nextScore[i]);
            System.out.println("If your score on exam 2 is " +
                nextScore[i]);
            System.out.println("your average will be " +
                possibleAverage);
        }
    }

    public static double getAverage(int n1, int n2)
    {
        return (n1 + n2) / 2.0;
    }
}
```

Sample Screen Output

```
Enter your score on exam 1:  
80  
If your score on exam 2 is 80  
your average will be 80.0  
If your score on exam 2 is 85  
your average will be 82.5  
If your score on exam 2 is 90  
your average will be 85.0
```

LISTING 7.6 Two Kinds of Equality (part 1 of 2)

```
/**
 * A demonstration program to test two arrays for equality.
 */
public class TestEquals
{
    public static void main(String[] args)
    {
        int[] a = new int[3];
        int[] b = new int[3];
        setArray(a);
        setArray(b);

        if (b == a)
            System.out.println("Equal by ==.");
        else
            System.out.println("Not equal by ==.");

        if (equals(b, a))
            System.out.println("Equal by the equals method.");
        else
            System.out.println("Not equal by the equals method.");
    }
}
```

*The arrays a and b
contain the same integers
in the same order.*

```

public static boolean equals(int[] a, int[] b)
{
    boolean elementsMatch = true;//tentatively
    if (a.length != b.length)
        elementsMatch = false;
    else
    {
        int i = 0;
        while (elementsMatch && (i < a.length))
        {
            if (a[i] != b[i])
                elementsMatch = false;
            i++;
        }
    }
    return elementsMatch;
}

public static void setArray(int[] array)
{
    for (int i = 0; i < array.length; i++)
        array[i] = i;
}
}

```

Screen Output

```

Not equal by ==.
Equal by the equals method.

```

LISTING 7.7 A Method That Returns an Array

```
import java.util.Scanner;

/**
 * A demonstration of a method that returns an array.
 */
public class ReturnArrayDemo
{
    public static void main(String[] args)
    {
        Scanner keyboard = new Scanner(System.in);
        System.out.println("Enter your score on exam 1:");
        int firstScore = keyboard.nextInt();
        int[] nextScore = new int[3];

        for (int i = 0; i < nextScore.length; i++)
            nextScore[i] = firstScore + 5 * i;

        double[] averageScore =
            getArrayOfAverages(firstScore, nextScore);
        for (int i = 0; i < nextScore.length; i++)
        {
            System.out.println("If your score on exam 2 is " +
                nextScore[i]);
            System.out.println("your average will be " +
                averageScore[i]);
        }
    }

    public static double[] getArrayOfAverages(int firstScore,
        int[] nextScore)
    {
        double[] temp = new double[nextScore.length];
        for (int i = 0; i < temp.length; i++)
            temp[i] = getAverage(firstScore, nextScore[i]);
        return temp;
    }

    public static double getAverage(int n1, int n2)
    {
        return (n1 + n2) / 2.0;
    }
}
```

The sample screen output is the same as in Listing 7.5.

LISTING 7.8 Using the Class `OneWayNoRepeatsList` (part 1 of 2)

```
import java.util.Scanner;

public class ListDemo
{
    public static final int MAX_SIZE = 3; //Assumed > 0

    public static void main(String[] args)
    {
        OneWayNoRepeatsList toDoList =
            new OneWayNoRepeatsList(MAX_SIZE);
        System.out.println(
            "Enter items for the list, when prompted.");
        boolean moreEntries = true;
        String next = null;
        Scanner keyboard = new Scanner(System.in);

        while (moreEntries && !toDoList.isFull())
        {
            System.out.println("Enter an item:");
            next = keyboard.nextLine();
            toDoList.addItem(next);

            if (toDoList.isFull())
            {
                System.out.println("List is now full.");
            }
            else
            {
                System.out.print("More items for the list? ");
                String ans = keyboard.nextLine();
                if (ans.trim().equalsIgnoreCase("no"))
                    moreEntries = false; //User says no more
            }
        }
    }
}
```

```

System.out.println("The list contains:");
int position = toDoList.START_POSITION;
next = toDoList.getEntryAt(position);
while (next != null) //null indicates end of list
{
    System.out.println(next);
    position++;
    next = toDoList.getEntryAt(position);
}
}
}

```

Sample Screen Output

```

Enter items for the list, when prompted.
Enter an item:
Buy milk
More items for the list? yes
Enter an item:
Walk dog
More items for the list? yes
Enter an item:
Buy milk
More items for the list? yes
Enter an item:
Write program
The list is now full.
The list contains:
Buy milk
Walk dog
Write program

```

LISTING 7.9 An Array Wrapped in a Class to Represent a List (part 1 of 3)

```
/**
 An object of this class is a special kind of list of strings.
 You can write the list only from beginning to end. You can add
 only to the end of the list. You cannot change individual en-
 tries, but you can erase the entire list and start over. No
 entry may appear more than once on the list. You can use int
 variables as position markers into the list. Position markers
 are similar to array indices, but are numbered starting with 1.
 */
public class OneWayNoRepeatsList
{
    public static int START_POSITION = 1;
    public static int DEFAULT_SIZE = 50;

}  
}
```

LISTING 7.11 Demonstration of the Method `selectionSort`

```
public class SelectionSortDemo
{
    public static void main(String[] args)
    {
        int[] b = {7, 5, 11, 2, 16, 4, 18, 14, 12, 30};

        display(b, "before");
        ArraySorter.selectionSort(b);
        display(b, "after");
    }

    public static void display(int[] array, String when)
    {
        System.out.println("Array values " + when + " sorting:");
        for (int i = 0; i < array.length; i++)
            System.out.print(array[i] + " ");
        System.out.println( );
    }
}
```

Screen Output

```
Array values before sorting:
7 5 11 2 16 4 18 14 12 30
Array values after sorting:
2 4 5 7 11 12 14 16 18 30
```

FIGURE 7.6 A Table of Values

Savings Account Balances for Various Interest Rates Compounded Annually (Rounded to Whole Dollar Amounts)						
Year	5.00%	5.50%	6.00%	6.50%	7.00%	7.50%
1	\$1050	\$1055	\$1060	\$1065	\$1070	\$1075

7	\$1477	\$1535	\$1594	\$1655	\$1718	\$1783
8	\$1551	\$1619	\$1689	\$1763	\$1838	\$1917
9	\$1629	\$1708	\$1791	\$1877	\$1967	\$2061

`table[3][2]` has
a value of 1262

LISTING 7.12 Using a Two-Dimensional Array (part 1 of 2)

```
/**
 * Displays a two-dimensional table showing how
 * interest rates affect bank balances.
 */
public class InterestTable
{
    public static void main(String[] args)
    {
        int[][] table = new int[10][6];
        for (int row = 0; row < 10; row++)
            for (int column = 0; column < 6; column++)
                table[row][column] =
                    getBalance(1000.00, row + 1, (5 + 0.5 *
                        column));

        System.out.println("Balances for Various Interest Rates " +
            "Compounded Annually");
        System.out.println("(Rounded to Whole Dollar Amounts)");
        System.out.println();
        System.out.println("Years 5.00% 5.50% 6.00% 6.50% " +
            "7.00% 7.50%");

        for (int row = 0; row < 10; row++)
        {
            System.out.print((row + 1) + " ");
            for (int column = 0; column < 6; column++)
                System.out.print("$" + table[row][column] + " ");
            System.out.println();
        }
    }
}
```

A real application would do something more with the array `table`. This is just a demonstration program.

```
/**  
Returns the balance in an account after a given number of years  
and interest rate with an initial balance of startBalance.  
Interest is compounded annually. The balance is rounded  
to a whole number.  
*/  
public static int getBalance(double startBalance, int years,  
                             double rate)  
{  
    double runningBalance = startBalance;  

```

Sample Screen Output

Balances for Various Interest Rates Compounded Annually
(Rounded to Whole Dollar Amounts)

Years	5.00%	5.50%	6.00%	6.50%	7.00%	7.50%
1	\$1050	\$1055	\$1060	\$1065	\$1070	\$1075
2	\$1103	\$1113	\$1124	\$1134	\$1145	\$1156
3	\$1158	\$1174	\$1191	\$1208	\$1225	\$1242
4	\$1216	\$1239	\$1262	\$1286	\$1311	\$1335
5	\$1276	\$1307	\$1338	\$1370	\$1403	\$1436
6	\$1340	\$1379	\$1419	\$1459	\$1501	\$1543
7	\$1407	\$1455	\$1504	\$1554	\$1606	\$1659
8	\$1477	\$1535	\$1594	\$1655	\$1718	\$1783
9	\$1551	\$1619	\$1689	\$1763	\$1838	\$1917
10	\$1629	\$1708	\$1791	\$1877	\$1967	\$2061

The last line is out of alignment because 10 has two digits. This is easy to fix, but that would clutter the discussion of arrays with extraneous concerns.

LISTING 7.13 A Multidimensional-Array Parameter

```
/**
 * Displays a two-dimensional table showing how interest
 * rates affect bank balances.
 */
public class InterestTable2
{
    public static final int ROWS = 10;
    public static final int COLUMNS = 6;

    public static void main(String[] args)
    {
        int[][] table = new int[ROWS][COLUMNS];
        for (int row = 0; row < ROWS; row++)
            for (int column = 0; column < COLUMNS; column++)
                table[row][column] =
                    getBalance(1000.00, row + 1, (5 + 0.5 * column));

        System.out.println("Balances for Various Interest Rates " +
            "Compounded Annually");
        System.out.println("(Rounded to Whole Dollar Amounts)");
        System.out.println();
        System.out.println("Years 5.00% 5.50% 6.00% 6.50% 7.00% 7.50%");

        showTable(table);
    }
}
```

```

/**
Precondition: The array anArray has ROWS rows and COLUMNS columns.
Postcondition: The array contents are displayed with dollar signs.
*/
public static void showTable(int[][] anArray)
{
    for (int row = 0; row < ROWS; row++)
    {
        System.out.print((row + 1) + " ");
        for (int column = 0; column < COLUMNS; column++)
            System.out.print("$" + anArray[row][column] + " ");
        System.out.println();
    }
}

public static int getBalance(double startBalance, int years, double rate)
<The rest of the definition of getBalance is the same as in Listing 7.12.>
}

```

A better definition of showTable is possible, as you will see.

The output is the same as in Listing 7.12.

LISTING 7.14 A Timekeeping Program (part 1 of 4)

```
/**
 * Class that records the time worked by each of a
 * company's employees during one five-day week.
 * A sample application is in the main method.
 */
public class TimeBook
{
    private int numberOfEmployees;
    private int[][] hours; //hours[i][j] has the hours for
                          //employee j on day i.
    private int[] weekHours; //weekHours[i] has the week's
                          //hours worked for employee i + 1.
    private int[] dayHours; //dayHours[i] has the total hours
                          //worked by all employees on day i.
    private static final int NUMBER_OF_WORKDAYS = 5;
    private static final int MON = 0;
    private static final int TUE = 1;
    private static final int WED = 2;
    private static final int THU = 3;
    private static final int FRI = 4;
}
```

```

/**
 Reads hours worked for each employee on each day of the
 work week into the two-dimensional array hours. (The method
 for input is just a stub in this preliminary version.)
 Computes the total weekly hours for each employee and
 the total daily hours for all employees combined.
*/
public static void main(String[] args)
{
    private static final int NUMBER_OF_EMPLOYEES = 3;
    TimeBook book = new TimeBook(NUMBER_OF_EMPLOYEES);
    book.setHours();
    book.update();
    book.showTable();
}

```

*A class generally has more methods. We have defined only the methods used in **main**.*

```

public TimeBook(int theNumberOfEmployees)
{
    numberOfEmployees = theNumberOfEmployees;
    hours = new int[NUMBER_OF_WORKDAYS][numberOfEmployees];
    weekHours = new int[numberOfEmployees];
    dayHours = new int[NUMBER_OF_WORKDAYS];
}

```

*The **final** program would replace the stub **setHours** with a complete method to obtain the employee data from the user.*

```

public void setHours() //This is a stub.
{
    hours[0][0] = 8; hours[0][1] = 0; hours[0][2] = 9;
    hours[1][0] = 8; hours[1][1] = 0; hours[1][2] = 9;
    hours[2][0] = 8; hours[2][1] = 8; hours[2][2] = 8;
    hours[3][0] = 8; hours[3][1] = 8; hours[3][2] = 4;
    hours[4][0] = 8; hours[4][1] = 8; hours[4][2] = 8;
}

```

```

public void update()
{
    computeWeekHours();
    computeDayHours();
}

```

```

private void computeWeekHours()
{
    for (employeeNumber = 1; employeeNumber <=
        numberOfEmployees; employeeNumber++)
        {//Process one employee:
            int sum = 0;
            for (int day = MON; day <= FRI; day++)
                sum = sum + hours[day][employeeNumber - 1];
                //sum contains the sum of all the hours worked in
                //one
                //week by the employee with number employeeNumber.
                weekHours[employeeNumber - 1] = sum;
        }
}

private void computeDayHours()
{
    for (int day = MON; day <= FRI; day++)
        {//Process one day (for all employees):
            int sum = 0;
            for (int employeeNumber = 1;
                employeeNumber <= numberOfEmployees;
                employeeNumber++)
                sum = sum + hours[day][employeeNumber - 1];
                //sum contains the sum of all hours worked by all
                //employees on one day.
                dayHours[day] = sum;
        }
}

```

```

public void showTable()
{
    // heading
    System.out.print("Employee ");
    for (int employeeNumber = 1;
         employeeNumber <= numberOfEmployees;
         employeeNumber++)
        System.out.print(employeeNumber + " ");
    System.out.println("Totals");
    System.out.println( );

    // row entries
    for (int day = MON; day <= FRI; day++)
    {
        System.out.print(getDayName(day) + " ");
        for (int column = 0; column < hours[day].length;
             column++)
            System.out.print(hours[day][column] + " ");
        System.out.println(dayHours[day]);
    }
}

```

The method `showTable` can and should be made more robust. See Programming Project 6.

```

        System.out.println( );
        System.out.print("Total = ");
        for (int column = 0; column < numberOfEmployees; column++)
            System.out.print(weekHours[column] + " ");
        System.out.println( );
    }
    //Converts 0 to "Monday", 1 to "Tuesday", etc.
    //Blanks are inserted to make all strings the same length.
    private String getDayName(int day)
    {
        String dayName = null;
        switch (day)
        {
            case MON:
                dayName = "Monday ";
                break;
            case TUE:
                dayName = "Tuesday ";
                break;
            case WED:
                dayName = "Wednesday";
                break;
            case THU:
                dayName = "Thursday ";
                break;
            case FRI:
                dayName = "Friday ";
                break;
            default:
                System.out.println("Fatal Error.");
                System.exit(0);
                break;
        }
        return dayName;
    }
}

```

Sample Screen Output

Employee	1	2	3	Totals
Monday	8	0	9	17
Tuesday	8	0	9	17
Wednesday	8	8	8	24
Thursday	8	8	4	20
Friday	8	8	8	24
Total =	40	24	38	

FIGURE 7.8 Arrays for the Class TimeBook

LISTING 7.15 An Applet with a Text Area *(part 1 of 2)*

```
import javax.swing.JApplet;
import javax.swing.JButton;
import javax.swing.JLabel;

{
    public static int LINES = 5;
    public static int CHAR_PER_LINE = 40;

    private JTextArea theText;
    private String question;
    private String answer;
    private String advice;
```

```

public void init()
{
    Container contentPane = getContentPane();
    contentPane.setLayout(new FlowLayout());

    JLabel instructions=
        new JLabel("I will answer any question, " +
            "but may need some advice from you.");
    contentPane.add(instructions);

    JButton getAnswerButton = new JButton("Get Answer");
    getAnswerButton.addActionListener(this);
    contentPane.add(getAnswerButton);

    JButton sendAdviceButton = new JButton("Send Advice");
    sendAdviceButton.addActionListener(this);
    contentPane.add(sendAdviceButton);

    JButton resetButton = new JButton("Reset");
    resetButton.addActionListener(this);
    contentPane.add(resetButton);

    JTextArea theText = new JTextArea(LINES, CHAR_PER_LINE);
    theText.setText("Questions and advice go here.");
    contentPane.add(theText);
    answer = "The answer is: Look around."; //first answer
}

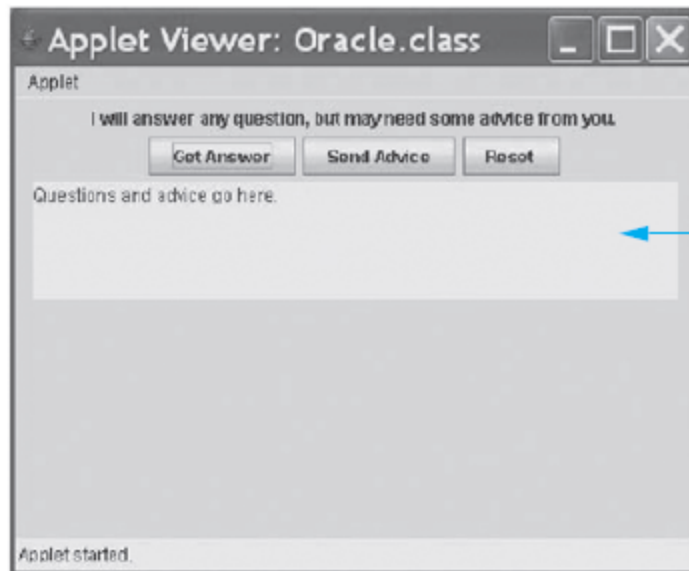

```

```

public void actionPerformed(ActionEvent e)
{
    String actionCommand = e.getActionCommand();
    if (actionCommand.equals("Get Answer"))
    {
        question = theText.getText();
        theText.setText("That is a difficult question.\n" +
            "Please give me some advice\n" +
            "and click the Send Advice button.");
    }
    else if (actionCommand.equals("Send Advice"))
    {
        advice = theText.getText();
        theText.setText("That advice helped.\n" +
            "You asked the question: " + question +
            "\n" + answer +
            "\nClick the Reset button and" +
            "\nleave the program on for others.");
        answer = "The answer is: " + advice;
    }
    else if (actionCommand.equals("Reset"))
    {
        theText.setText("Questions and advice go here.");
    }
    else
        theText.setText("Error");
}
}

```

Applet Output

This is the text area.

The positions of the buttons will vary depending on local conditions on your computer. To clean up the display, use your mouse to resize the applet window.

FIGURE 7.9 A Polygon and a Polyline

A polygon

A polyline

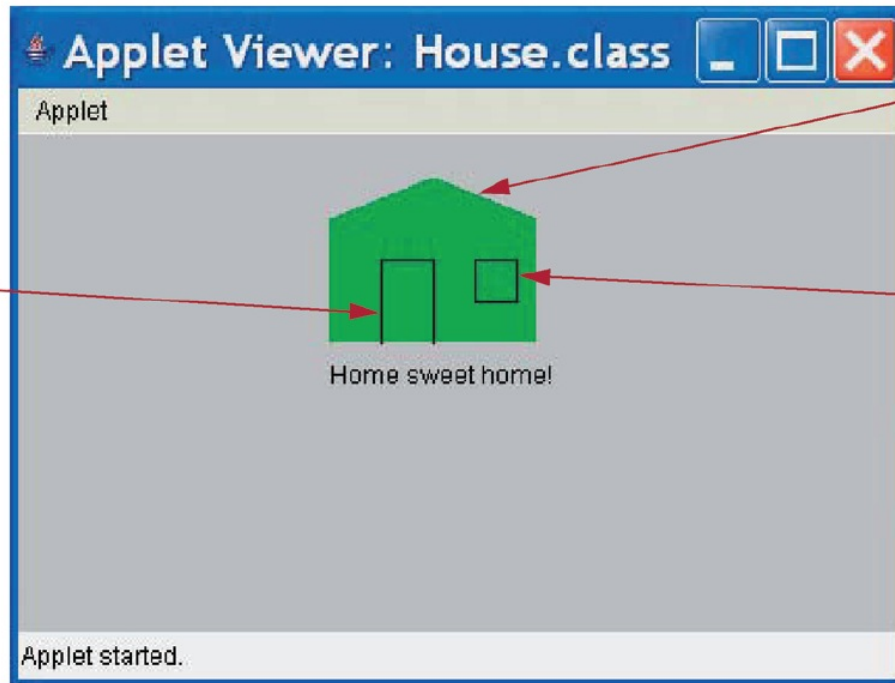

LISTING 7.16 An Applet with Polygons and a Polyline

```
import javax.swing.JApplet;
import java.awt.Color;
import java.awt.Graphics;

public class House extends JApplet
{
    private int[] xHouse = {150, 150, 200, 250, 250};
    private int[] yHouse = {100, 40, 20, 40, 100};
    private int[] xDoor = {175, 175, 200, 200};
    private int[] yDoor = {100, 60, 60, 100};
    private int[] xWindow = {220, 220, 240, 240};
    private int[] yWindow = {60, 80, 80, 60};

    public void paint(Graphics canvas)
    {
        this.setBackground(Color.LIGHT_GRAY);
        canvas.setColor(Color.GREEN);
        canvas.fillPolygon(xHouse, yHouse, xHouse.length);
        canvas.setColor(Color.BLACK);
        canvas.drawPolyline(xDoor, yDoor, xDoor.length);
        canvas.drawPolygon(xWindow, yWindow, xWindow.length);
        canvas.drawString("Home sweet home!", 150, 120);
    }
}
```

Applet Output

The house is a filled polygon.

The door is a polyline.

The window is an ordinary polygon.
