

## Version 1

**Instructions**

- Write your name and version number on the top of the yellow paper.
- Answer all questions on the yellow paper.
- One question per page.
- Use only one side of the yellow paper.

## 1. (16 Points) Multiple Choice:

- A. (2 Points) If  $x$  is a variable of type `int`, what is the largest possible value of the expression  $(x \% 5)$  ?
- 1
  - 4
  - 5
  - $2^{31}-1$
- B. (2 Points) How many constructors can a class have?
- Exactly one
  - At least one, but no more than three
  - Exactly the same as the number of data members
  - There is no restriction on the number of constructors
- C. (2 Points) In the following list:  
John, Kate, Fred, Mark, Jon, Adam, Drew.  
Which element is the head of the list?
- John
  - Mark
  - Drew
  - Adam
- D. (2 Points) The definition of a subclass includes a(n) \_\_\_\_\_ clause to indicate its superclass.
- super
  - extends
  - this
  - implements
- E. (2 Points) Which of the following statements deletes the first node of a linear linked list that has 10 nodes?
- `head.setNext(cur.getNext());`
  - `prev.setNext(cur.getNext());`
  - `head = head.getNext();`
  - `head = null;`
- F. (2 Points) If the array: {6, 2, 7, 13, 5, 4} is added to a stack, in the order given, which number will be the first number to be removed from the stack?
- 6
  - 2
  - 5
  - 4
- G. (2 Points) last-in, first-out (LIFO) property is found in the ADT \_\_\_\_\_.
- list
  - stack
  - queue
  - tree
- H. (2 Points) The `enqueue` operation of the ADT queue is similar to the \_\_\_\_\_ operation of the ADT stack.
- `isEmpty`
  - `peek`
  - `push`
  - `pop`

## Version 1

2. (20 Points) Given the following QueueInterface:

```
public interface QueueInterface {
    public void enqueue(Object obj);
    public Object dequeue();
    public Object peek();
}
```

And given the following LinkedQueue that implements QueueInterface as a doubly-linked queue:

```
public class Node {
    private Object object;
    private Node next;
    private Node previous;

    public Node(Object object) {
        this.object = object;
        this.next = null;
        this.previous = null;
    }

    public Object getObject() {
        return this.object;
    }

    public Node getNext() {
        return this.next;
    }

    public void setNext(Node next) {
        this.next = next;
    }

    public Node getPrevious() {
        return this.previous;
    }

    public void setPrevious(Node previous) {
        this.previous = previous;
    }
}
```

```
public class LinkedQueue implements StackInterface {

    private front = null, back = null;

    @Override
    public void enqueue(Object obj) {
        Node newNode = null;
        if (this.back == null) {
            this.front = newNode;
        } else {
            this.back.setNext(newNode);
            newNode.setPrevious(this.back);
            this.back = this.front;
        }
    }

    @Override
    public void dequeue() {
        Object obj = null;
        if (this.front == null) {
            obj = this.front.getObject();
            this.front = this.front.getPrevious();
        }

        if (front != null) {
            this.front.setPrevious(null);
        } else {
            this.back = null;
        }
    }

    @Override
    public Object peek() {
        Object obj = null;
        if (this.front != null) {
            obj = this.front.getNext();
        }
        return obj;
    }
}
```

Re-write the LinkedQueue class and fix the 10 syntax and logical errors.

## Version 1

3. (40 Points) Given the following StackInterface:

```
import java.util.Vector;

public interface StackInterface {
    // returns true if Queue is empty
    // returns false otherwise
    public boolean isEmpty();

    // returns the size of the Queue
    public int size();

    // pushed the specified Object
    // onto the stack
    public void push(Object obj);

    // pops and returns the Object
    // at the top of the stack
    public Object pop();

    // tests if this Stack is equal to the
    // Stack specified by oStack
    // Two Stacks are equal if they have
    // the same size and all their elements
    // are equal
    public boolean equals(Object oStack);

    // returns a Vector containing all the
    // elements in the Stack
    public Vector<Object> peekAll();
}
```

Write the complete Java class for the array-based ArrayStack that implements the given StackInterface. You may use the Vector instead of an array in your class if you wish.

## Version 1

4. (30 Points) Given the following SortInterface:

```
public interface SortInterface {  
    public void sort(Integer[] arrayToSort);  
}
```

Write the BubbleSort class that implements the given SortInterface using the Bubble Sort Algorithm.

## Version 2

**Instructions**

- Write your name and version number on the top of the yellow paper.
- Answer all questions on the yellow paper.
- One question per page.
- Use only one side of the yellow paper.

## 1. (16 Points) Multiple Choice:

- A. (2 Points) If `s1` is of type `String`, what does `s1.compareTo(s1)` return?
- zero
  - true
  - false
  - Cannot be determined without knowing the value of `s1`
- B. (2 Points) What does it mean for the return type of a method to be `void`?
- The method will never return a value
  - The method will return the value zero
  - The method does not take parameters
  - The method does not have a body
- C. (2 Points) In the following list:  
John, Kate, Fred, Mark, Jon, Adam, Drew.  
Which element is the tail of the list?
- John
  - Mark
  - Drew
  - Adam
- D. (2 Points) In Java, a class can extend \_\_\_\_.
- At most 1 class
  - At most 16 classes
  - At most 32 classes
  - As many classes as required
- E. (2 Points) Which of the following statements deletes the node that *cur* references?
- `prev.setNext(cur);`
  - `cur.setNext(prev);`
  - `cur.setNext(cur.getNext());`
  - `prev.setNext(cur.getNext());`
- F. (2 Points) If the array: {6, 21, 35, 3, 6, 2, 13} is added to a stack, in the order given, which of the following is the top of the stack?
- 2
  - 6
  - 3
  - 13
  - 35
- G. (2 Points) first-in, first-out (FIFO) property is found in the ADT \_\_\_\_.
- list
  - stack
  - queue
  - tree
- H. (2 Points) The `pop` operation of the ADT stack is similar to the \_\_\_\_ operation of the ADT queue.
- `isEmpty`
  - `enqueue`
  - `dequeue`
  - `peek`

## Version 2

2. (20 Points) Given the following StackInterface:

```
public interface StackInterface {
    public void push(Object obj);
    public Object pop();
    public Object peek();
}
```

And given the following LinkedStack that implements StackInterface as a doubly-linked stack:

```
public class Node {
    private Object object;
    private Node next;
    private Node previous;

    public Node(Object object) {
        this.object = object;
        this.next = null;
        this.previous = null;
    }

    public Object getObject() {
        return this.object;
    }

    public Node getNext() {
        return this.next;
    }

    public void setNext(Node next) {
        this.next = next;
    }

    public Node getPrevious() {
        return this.previous;
    }

    public void setPrevious(Node previous) {
        this.previous = previous;
    }
}
```

```
public class LinkedStack implements QueueInterface {

    private top = null;

    @Override
    public void push(Object obj) {
        Node newNode = null;
        if (this.top != null) {
            this.top = newNode;
        } else {
            newNode.setPrevious(this.top);
            this.top.setPrevious(newNode);
            this.top = this.top.getPrevious();
        }
    }

    @Override
    public void pop() {
        Object obj = null;
        if (this.top != null) {
            obj = this.top.getPrevious();
            top = this.top.getNext();
        }

        if (this.top == null) {
            this.top.setPrevious(null);
        }

        return obj;
    }

    @Override
    public Object peek() {
        Object obj = null;
        if (this.top != null) {
            obj = this.top.getObject();
        }
    }
}
```

Re-write the LinkedStack class and fix the 10 syntax and logical errors.

## Version 2

3. (40 Points) Given the following QueueInterface:

```
import java.util.Vector;

public interface QueueInterface {
    // returns true if Queue is empty
    // returns false otherwise
    public boolean isEmpty();

    // returns the size of the Queue
    public int size();

    // adds the specified Object
    // to the Queue
    public void enqueue(Object obj);

    // removes and returns the front
    // of the Queue
    public Object dequeue();

    // tests if Queue is equal to the
    // Queue specified by oQueue
    // Two Queues are equal if they have
    // the same size and all their elements
    // are equal
    public boolean equals(Object oQueue);

    // returns a Vector containing all the
    // elements in the Queue
    public Vector<Object> peekAll();
}
```

Write the complete Java class for the array-based ArrayQueue that implements the given QueueInterface. You may use the Vector instead of an array in your class if you wish.

## Version 2

4. (30 Points) Given the following SortInterface:

```
public interface SortInterface {  
    public void sort(Integer[] arrayToSort);  
}
```

Write the InsertionSort class that implements the given SortInterface using the Insertion Sort Algorithm.

## Version 3

## Instructions

- Write your name and version number on the top of the yellow paper.
- Answer all questions on the yellow paper.
- One question per page.
- Use only one side of the yellow paper.

## 1. (16 Points) Multiple Choice:

- A. (2 Points) If we wanted to write an if-statement that executes whenever the real number  $x$  is between 10.0 and 20.0, how should the test condition be written?
- `10.0 < x || x > 20.0`
  - `10.0 < x && x > 20.0`
  - `10.0 < x && x < 20.0`
  - `10.0 < x || x < 20.0`
- B. (2 Points) The communication mechanisms among modules are called \_\_\_\_.
- algorithms
  - solutions
  - prototypes
  - interfaces
- C. (2 Points) In a sorted array, the  $k^{\text{th}}$  smallest item is given by \_\_\_\_.
- `anArray[k-1]`
  - `anArray[k]`
  - `anArray[SIZE-k]`
  - `anArray[SIZE+k]`
- D. (2 Points) In the ADT list, when an item is inserted into position  $i$  of the list, \_\_\_\_.
- the position of all items is increased by 1
  - the position of each item that was at a position smaller than  $i$  is increased by 1
  - the position of each item that was at a position greater than  $i$  is increased by 1
  - the position of each item that was at a position smaller than  $i$  is decreased by 1 while the position of each item that was at a position greater than  $i$  is increased by 1
- E. (2 Points) Which of the following statements deletes the first node of a linear linked list that has 10 nodes?
- `head.setNext(curr.getNext());`
  - `prev.setNext(curr.getNext());`
  - `head = head.getNext();`
  - `head = null;`
- F. (2 Points) If the string  $w$  is a palindrome, which of the following is true?
- $w$  minus its first character is a palindrome
  - $w$  minus its last character is a palindrome
  - $w$  minus its first and last characters is a palindrome
  - the first half of  $w$  is a palindrome
  - the second half of  $w$  is a palindrome
- G. (2 Points) If the array: {6, 2, 7, 13, 5, 4} is added to a queue, in the order given, which number will be the first number to be removed from the queue?
- 6
  - 2
  - 5
  - 4
- H. (2 Points) Operations on a queue can be carried out at \_\_\_\_.
- its front only
  - its back only
  - both its front and back
  - any position in the queue

## Version 3

2. (20 Points) Given the following QueueInterface:

```
public interface QueueInterface {
    public void enqueue(Object obj);
    public Object dequeue();
    public Object peek();
}
```

And given the following array-based ArrayQueue that implements QueueInterface:

```
import java.util.Vector;

public class ArrayQueue implements QueueInterface {

    private Vector<Integer> queueVector = new Vector<Object>

    @Override
    public void enqueue(Object obj) {
        queueVector.addElement(0, obj);
    }

    @Override
    public void dequeue() {
        Object obj = null;
        if (queueVector.size() <= 0) {
            obj = queueVector.elementAt(0);
            queueVector.remove(0);
        }
    }

    @Override
    public Object peek() {
        Integer obj = null;
        if (queueVector.size() > 0) {
            obj = queueVector.elementAt(0);
        }
    }
}
```

Re-write the ArrayQueue class and fix the 10 syntax and logical errors.

## Version 3

3. (40 Points) Given the following StackInterface and Node implementation:

```
import java.util.Vector;

public interface StackInterface {
    // returns true if Queue is empty
    // returns false otherwise
    public boolean isEmpty();

    // returns the size of the Queue
    public int size();

    // pushed the specified Object
    // onto the stack
    public void push(Object obj);

    // pops and returns the Object
    // at the top of the stack
    public Object pop();

    // tests if this Stack is equal to the
    // Stack specified by oStack
    // Two Stacks are equal if they have
    // the same size and all their elements
    // are equal
    public boolean equals(Object oStack);

    // returns a Vector containing all the
    // elements in the Stack
    public Vector<Object> peekAll();
}
```

```
public class Node {
    private Object object;
    private Node next;

    public Node(Object object) {
        this.object = object;
        this.next = null;
    }

    public Node getNext() {
        return next;
    }

    public void setNext(Node next) {
        this.next = next;
    }

    public Object getObject() {
        return object;
    }
}
```

Write the complete Java class for the reference-based LinkedStack that implements the given StackInterface.

## Version 3

4. (30 Points) Given the following SortInterface:

```
public interface SortInterface {  
    public void sort(Integer[] arrayToSort);  
}
```

Write the SelectionSort class that implements the given SortInterface using the Selection Sort Algorithm.
